game closing down

Posted by Aznagroth - 25 Mar 2012 15:27

I just got a problem with my warlords. when I try to start it it just closes down. I get the OK box you get because of the memoryproblem and then when I click single player the game just disappears. I haven't done anything recently that I haven't been doing the last week.

I have tried restarting the VM and I have restarted the host. When I press ctrl-alt-delete I only get the host's taskmanager so I can't see if there are any instances of the program running that should be shut down.

please help!

edit1: I was able to start task manager inside the game. There were no processes called darklord.exe running that I could shut down.

Have you resized the VM window recently?

Sorry about the short last post.

I've had a few problems with resizing resulting in freezes and even directdraw errors. I managed to reset it and no problems now as long as I don't touch the size.

Other than that the only problem I've had with crashes or freeze was during alt+tab (or alt+x) inside the VM. A lot better than in w7!

One more thing:

If you set the size/resolution of the VM window small enough the game may crash on startup. If so, you should try to reduce the resolution of the game from the setup screen.
